

# No Straight Pipe - No Problem

Trust the HbMAG for proven accuracy in non-standard pipe configurations

The HbMAG is capable of exceptional accuracy even in non-standard piping configurations where the recommended minimum of 5 diameters upstream and 3 diameters downstream is not achievable due to the existing infrastructure.

The HbMAG received certification for  $\pm 2\%$  accuracy in the normal flow range of the meter with zero diameter upstream and zero diameter downstream straight runs of pipe from the meter.

This makes them a great choice for installations where other meters can't perform due to the lack of sufficient straight runs of piping.
